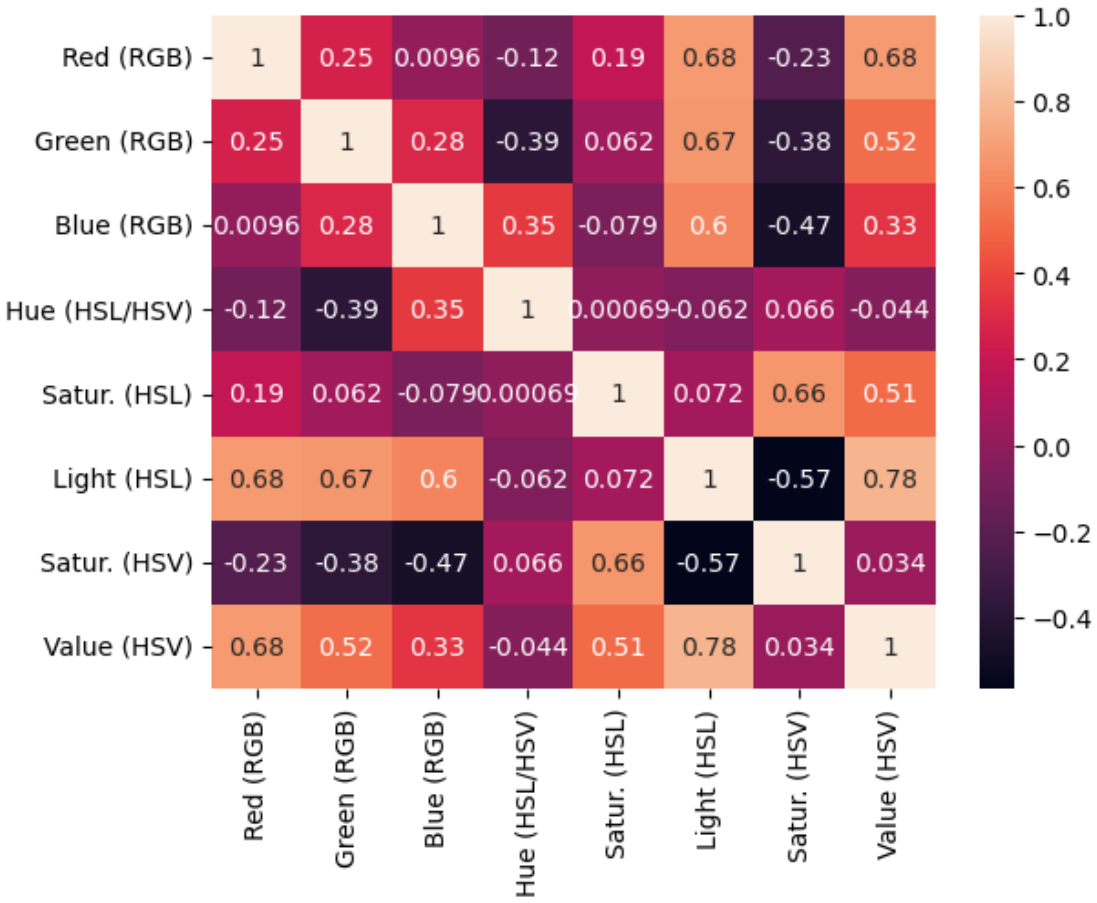
Since we will look for correlations with the color variables for the animals, we want to account for the fact that those color variables are drawn from this dataset, and so there could be a sampling bias in how the colors are interpreted.

Here, it looks like there is a weak correlation between red and green and between green and blue, but red and blue are mostly unrelated.

[6]:
```
sns.heatmap(data=df_colors.corr(), annot=True)
```

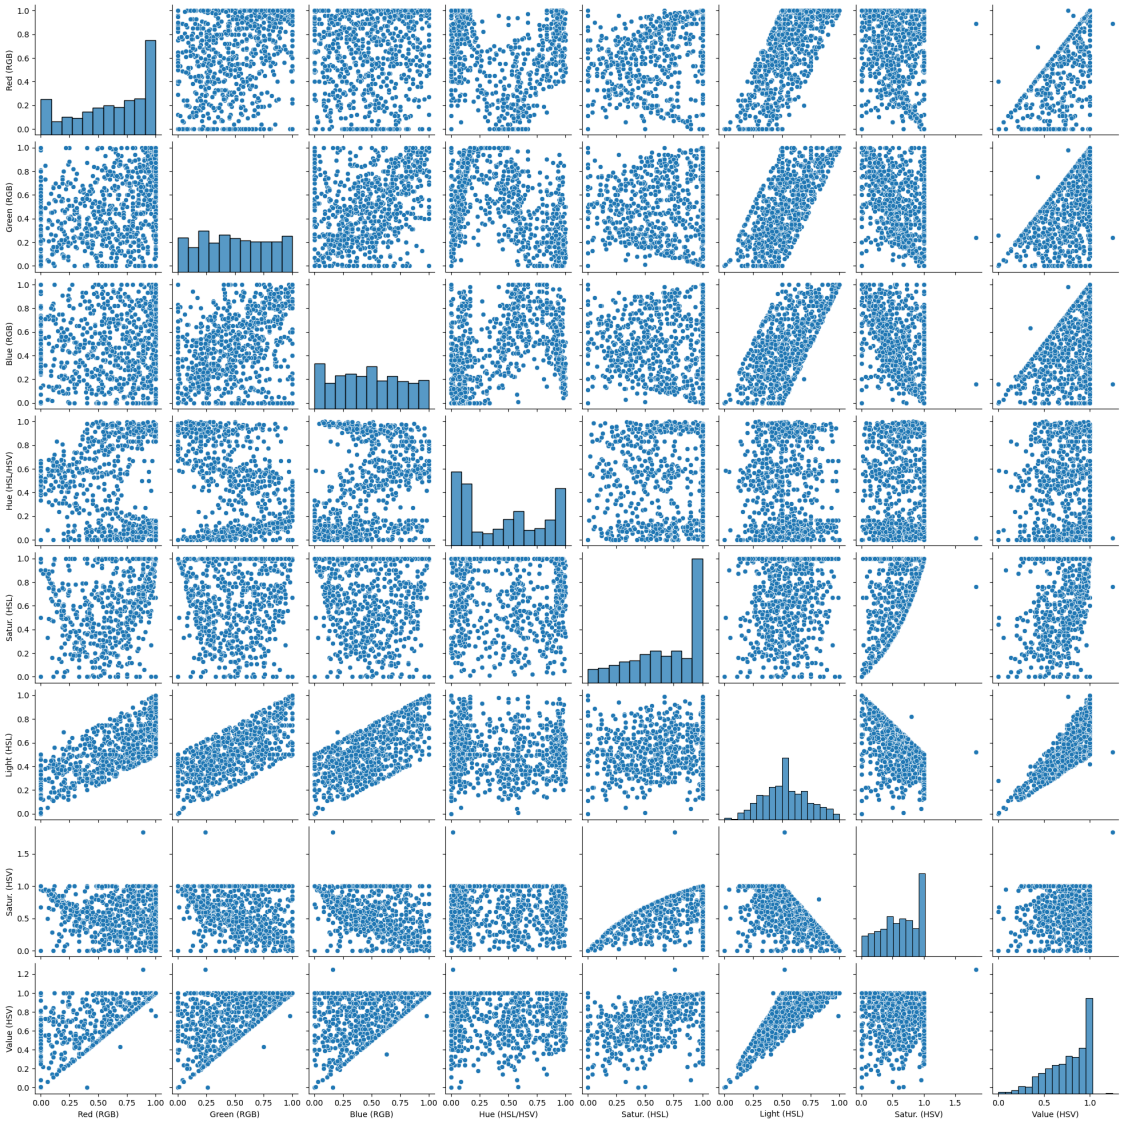
```
/tmp/ipykernel_29164/3282312412.py:1: FutureWarning: The default value of
numeric_only in DataFrame.corr is deprecated. In a future version, it will
default to False. Select only valid columns or specify the value of numeric_only
to silence this warning.
  sns.heatmap(data=df_colors.corr(), annot=True)
```

[6]: <AxesSubplot:>



[7]:
```
sns.pairplot(df_colors)
```

[7]: <seaborn.axisgrid.PairGrid at 0x7f64dbda84c0>



Colors are looked up by splitting the query color name by words, then looking for the first exact match with one of the words, but if there are none then it looks for any color with a name containing any of the query words.

For example, consider looking up colors with the word "brown" in their name. Notice that none of the colors are literally "brown" though they all have "brown" in the name.

[8]:
```
df_colors.loc[df_colors.Name.str.contains("brown")]
```

[8]:

	Name	Hex (RGB)	Red (RGB)	Green (RGB)	Blue (RGB)	\

2.2 Height ~ adopted?

Is the average height of a breed correlated with its likelihood of being adopted? The Pearson correlation coefficient was Corr(Adopted, average height) 0.2286839421877296.

3.2 Breed characteristics

This analysis considers individual animals and looks for correlations between characteristics of their breed and their outcome.

It looks like the animals belonging to a breed with an average height around 20-25 (inches?) are more likely to be adopted than others, and animals between 5-12 inches are less likely than others to be adopted.

TODO: interpret the other graphs. Why are the different lifespan variables distributed the way they are, and why are they distributed differently compared to each other?

[35]:
```
df_out_1 = df_out.assign(Adopted=df_out.Adopted.fillna(False))
df_out_with_breeds_info_1 = df_out_with_breeds_info.assign(Adopted=df_out.
 ↪Adopted.fillna(False))

def correlo_histogram(df, independent, dependent, binwidth):
    print(f'{independent} ~ {dependent}')
    sns.histplot(data=df,
                 x=independent,
                 hue=dependent,
                 multiple='fill',
```

```
            binwidth=binwidth)
    plt.show()

3.3 Name

This section will attempt to look for correlations between the name of animals and their outcome.

[36]:
```
# %pip install tensorflow
# %pip install tensorflow_hub

# # NOTE: when I ran this, it said:
# # "Note: you may need to restart the kernel to use updated packages."
```
